DETAILED ACTION

Claims 27 to 50 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on August 29, 2008.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1 to 26 and 51 to 60 are rejected under 35 U.S.C. 103(a) as being unpatentable over Neil et al. (J. of Crystal Growth 196) in view of Graham et al (j. of Colloid and interface sci.).

The Neil et al reference teaches a method of predicting an equilibrium condition for biomacromolecule, note entire reference. A biomacromolecule, a protein, is

prepared in a solution with a solvent. A variable is selected to be changed in the solution. The effect of the changed in the variable is monitored and recorded, Note page 379. The results are then used to create a condition to exceed the equilibrium and crystallization of the biomacromolecule, note page 381. The variable can be concentration, pH or temperature. The sole difference between the instant claims and the prior art is the surface tension. However, the Graham et al reference teaches that surface tension can be monitored and is affected by the variable. Also, to use that information to aid in the crystallization, note page 404-405. It would have been obvious to one of ordinary skill in the art to modify the Neil et al process by the teachings of the Graham et al reference to monitor surface tension or pressure in order to increase the control over the crystallization of the biomacromolecule.
